

WOLFPACK MEMORY ARCHITECTURE v1

This document establishes formal build-phase doctrine and operational standards for the Wolfpack Operating System ecosystem. The purpose is to preserve governance integrity, operational survivability, institutional intelligence, and long-term scalability while minimizing human operational dependency.

Purpose

- Establish a canonical institutional memory architecture for the Wolfpack ecosystem.
- Ensure memory remains structured, auditable, retrievable, compressible, and operationally useful.
- Prevent entropy, fragmentation, and undocumented tribal knowledge.

Core Doctrine

- GitHub remains canonical memory source-of-truth.
- Chat history is not institutional memory.
- Operational memory must remain human-readable and AI-readable.
- Memory systems must preserve rollback capability and provenance.

Canonical Memory Taxonomy

- memory/canon
- memory/decisions
- memory/deployments
- memory/incidents
- memory/opportunities
- memory/customers
- memory/operators
- memory/systems
- memory/summaries

Memory Ingestion Standards

- All deployments automatically generate deployment records.
- All incidents automatically generate incident records.
- All architectural changes require decision entries.
- All ingestion requires timestamps, provenance, and confidence metadata.

Compression and Summarization

- Raw operational data may be compressed into higher-order summaries.

- Summaries must preserve provenance references.
- No summary may overwrite canonical raw memory.

Retrieval Hierarchy

- Canonical memory has priority over generated summaries.
- Recent incidents and deployments receive temporal priority.
- Governance records override heuristic interpretations.

Memory Safety

- Unbounded memory rewriting is prohibited.
- Autonomous memory deletion is prohibited.
- Critical memory categories require immutable archival retention.

Definition of Done

- All operational systems emit structured memory artifacts.
- All critical events become institutional learning assets.
- Institutional memory compounds operational intelligence over time.

This specification is considered canonical governance guidance for future Wolfpack ecosystem implementation phases and architectural reviews.
