

Wolfpack Operating System — Doc Pack v1

WOLFPACK OPERATING SYSTEM — DOC PACK V1

01 — WOLFPACK CANON

Purpose:

Build, govern, deploy, and evolve AI-native operational systems that produce durable recurring revenue with minimal human overhead and high operational stability.

Core doctrine:

- stability before expansion
- boring systems win
- governance before automation
- human API reduction
- source-of-truth integrity
- vendor replaceability
- operational calm
- compounding intelligence

Core roles:

- Eterna
- Operator
- Architect
- Critic
- Economist
- Compliance Officer
- Memory Keeper
- Opportunity Analyst
- Deployment Governor
- UX Steward
- Evolution Sentinel

02 — SYSTEM ARCHITECTURE

Core layers:

- Eterna → orchestration/intelligence
- OpenClaw → execution/runtime
- Helm → operational infrastructure
- Wolfpack → governance/risk
- GitHub → canonical source of truth
- Render/Supabase → replaceable infrastructure/runtime

Approved v0.1 infrastructure:

- GitHub
- OpenClaw
- Render
- Supabase
- ChatGPT Project

Forbidden v0.1 behaviors:

- autonomous outbound sales
- autonomous financial actions
- uncontrolled production changes
- ungoverned self-modifying systems

03 — DEPLOYMENT GOVERNANCE

Mandatory flow:

Scope Check

- Preflight Validation
- Wolfpack Review
- Deployment Approval
- Push
- Runtime Validation
- Incident Monitoring
- Rollback Window

Required validation:

- syntax checks
- diff review
- rollback target
- secret exposure check
- no unrelated changes

Blocked conditions:

- unstable runtime
- unsupported APIs
- missing rollback
- governance bypass
- unresolved incidents

04 — INCIDENT AND DEPLOY LOGGING

Every deployment requires:

- deployment id
- timestamp
- commit hash
- changed files
- rollback target
- validation result

Every incident requires:

- incident id
- symptoms
- root cause
- rollback actions
- prevention actions
- final status

Operational philosophy:

Failures become institutional learning.

05 — AI RECEPTIONIST STATUS

Current state:

- stable runtime restored
- OpenClaw direct GitHub deployment operational
- production stable
- governance layer active

Blocked features:

- input_audio_transcription
- recording ingestion
- unsupported realtime modifications

Priority order:

1. stability
2. governance
3. observability
4. memory
5. controlled expansion

06 — OPPORTUNITY RADAR SPEC

Purpose:

Continuously identify profitable operational systems and recurring-revenue opportunities.

Inputs:

- AI newsletters
- SMB operator communities
- workflow case studies
- SaaS ecosystem changes
- AI tooling ecosystem

Outputs:

Opportunity Briefs containing:

- business model
- MRR potential
- operational burden
- implementation complexity
- retention likelihood
- Wolfpack recommendation

The radar prioritizes:

- boring recurring revenue
- operational reliability
- low support burden
- high retention
- replaceable infrastructure

07 — GPT ROLE PROMPTS

Core GPTs:

1. Eterna Command
2. Wolfpack Red Team
3. OpenClaw Deployment Governor
4. Opportunity Radar
5. Memory Keeper

Cross-GPT doctrine:

- operational reliability
- governance discipline
- rollback preservation
- calm/simple UX
- boring stable systems

Forbidden behaviors:

- uncontrolled deployment
- autonomous irreversible actions
- unsupported production experimentation
- governance bypass

Success definition:

The ecosystem succeeds when:

- deployment stability improves
- institutional memory compounds
- recurring revenue opportunities improve
- governance strengthens over time
